Understanding Encoder/BERT at high-level

(Univ. of Washington, Seattle)

Transformer Types in Practice

Encoder Only

- BERT, SBERT, ViTransformer, etc
- Uses only self-attention and FFN blocks
- Good for classification, summarization, intent detection, image embeddings, etc

Encoder-Decoder

T5, BART. Also uses encoder-decoder attention

Decoder Only

- GPT, Llama, DeepSeek, etc
- Good for many tasks including encoder-only tasks and also generation tasks
- Uses self-attention and FFN blocks

Parsing Encoder: Multi-Head Attention and FFN

Positional Encoding

8 / 46

Parsing Encoder: Multi-Head Attention and FFN

9/46

As we encode the word "it", one attention head is focusing most on "the animal", while another is focusing on "tired" -- in a sense, the model's representation of the word "it" bakes in some of the representation of both "animal" and "tired".

Every row in the X matrix corresponds to a word in the input sentence. We again see the difference in size of the embedding vector (512, or 4 boxes in the figure), and the q/k/v vectors (64, or 3 boxes in the figure)

Parsing Encoder: Multi-Head Attention and FFN

Layer Normalization

Self-Attention Math Walk-through

FFN Math Walk-through

Let's go through a self-attention python calculation exercise to understand it better. Let x = [[1, 2, 3, -1], [3, -4, -7, 5]] be the input token embeddings. In the first layer of the encoder of the transformer, the weight matrices are given by $W^Q = [[-1, 2, 0], [2, 3, -5], [1, 0, 0], [-3, 1, 2]],$ $W^K = [[1, 2, 3], [2, 4, 3], [3, 0, 3], [-1, 5, 2]],$ $W^V = [[-1, -2, 3], [2, -4, 0], [0, 0, 1], [1, 0, -7]].$ Compute the soft-max similar to what we did in the previous walk-through. You can use python matrix multiplication (e.g. numpy) to arrive at the solution. Question is which token (token 1 or token 2) does token 2 place more attention on and what is the attention probability?

BERT pre-training

Two Tasks

- Masked LM Model: Mask a word in the middle of a sentence and have BERT predict the masked word
- Onext-sentence prediction: Predict the next sentence Use both positive and negative labels. How are these generated?

BERT pre-training

Two Tasks

- Masked LM Model: Mask a word in the middle of a sentence and have BERT predict the masked word
- Onext-sentence prediction: Predict the next sentence Use both positive and negative labels. How are these generated?

ICE: Supervised or Un-supervised?

• Are the above two tasks supervised or un-supervised?

Uses Siamese Twins architecture

Advantages of sBERT

More optimized for Sentence Similarity Search.

Sentence BERT - Siamese BERT architecture

Figure 1: SBERT architecture with classification objective function, e.g., for fine-tuning on SNLI dataset. The two BERT networks have tied weights (siamese network structure).

Figure 2: SBERT architecture at inference, for example, to compute similarity scores. This architecture is also used with the regression objective function.

Loss Function for SBERT

Pooling Strategy for SBERT

	NLI	STSb			
Pooling Strategy					
MEAN	80.78	87.44			
MAX	79.07	69.92			
CLS	79.80	86.62			
Concatenation					
(u,v)	66.04	-			
(u-v)	69.78	-			
(u * v)	70.54	-			
(u-v , u * v)	78.37	-			
(u, v, u * v)	77.44	-			
(u,v, u-v)	80.78	-			
(u,v, u-v ,ust v)	80.44	-			

Table 6: SBERT trained on NLI data with the classification objective function, on the STS benchmark (STSb) with the regression objective function. Configurations are evaluated on the development set of the STSb using cosine-similarity and Spearman's rank correlation. For the concatenation methods, we only report scores with MEAN pooling strategy.

Sentence BERT Cosine Similarity Results

Model	STS12	STS13	STS14	STS15	STS16	STSb	SICK-R	Avg.
Avg. GloVe embeddings	55.14	70.66	59.73	68.25	63.66	58.02	53.76	61.32
Avg. BERT embeddings	38.78	57.98	57.98	63.15	61.06	46.35	58.40	54.81
BERT CLS-vector	20.16	30.01	20.09	36.88	38.08	16.50	42.63	29.19

SRoBERTa-NLI-large	74.53	77.00	73.18	81.85	76.82	79.10	74.29	76.68

Table 1: Spearman rank correlation ρ between the cosine similarity of sentence representations and the gold labels for various Textual Similarity (STS) tasks. Performance is reported by convention as $\rho \times 100$. STS12-STS16: SemEval 2012-2016, STSb: STSbenchmark, SICK-R: SICK relatedness dataset.

SentEval DataSets

- MR: Sentiment prediction for movie reviews snippets on a five start scale (Pang and Lee, 2005).
- CR: Sentiment prediction of customer product reviews (Hu and Liu, 2004).
- **SUBJ**: Subjectivity prediction of sentences from movie reviews and plot summaries (Pang and Lee, 2004).
- MPQA: Phrase level opinion polarity classification from newswire (Wiebe et al., 2005).
- SST: Stanford Sentiment Treebank with binary labels (Socher et al., 2013).
- **TREC**: Fine grained question-type classification from TREC (Li and Roth, 2002).
- MRPC: Microsoft Research Paraphrase Corpus from parallel news sources (Dolan et al., 2004).

Sentence BERT on SentEval Results

Model	MR	CR	SUBJ	MPQA	SST	TREC	MRPC	Avg.
Avg. GloVe embeddings	77.25	78.30	91.17	87.85	80.18	83.0	72.87	81.52
Avg. fast-text embeddings	77.96	79.23	91.68	87.81	82.15	83.6	74.49	82.42
Avg. BERT embeddings	78.66	86.25	94.37	88.66	84.40	92.8	69.45	84.94
BERT CLS-vector	78.68	84.85	94.21	88.23	84.13	91.4	71.13	84.66
InferSent - GloVe	81.57	86.54	92.50	90.38	84.18	88.2	75.77	85.59
Universal Sentence Encoder	80.09	85.19	93.98	86.70	86.38	93.2	70.14	85.10
SBERT-NLI-base	83.64	89.43	94.39	89.86	88.96	89.6	76.00	87.41
SBERT-NLI-large	84.88	90.07	94.52	90.33	90.66	87.4	75.94	87.69

Table 5: Evaluation of SBERT sentence embeddings using the SentEval toolkit. SentEval evaluates sentence embeddings on different sentence classification tasks by training a logistic regression classifier using the sentence embeddings as features. Scores are based on a 10-fold cross-validation.

Let's say we want to automatically convert a **Natural Language Query** to a **SQL** query. E.g. "Which quarter in the past 5 years had the most amount of sales for fashion products" to "SELECT ... FROM ... WHERE ..." What kind of deep learning architecture would support this problem?

- SBERT
- ISTM to LSTM sequence model
- 3 GPT-2
- Feed Forward Neural Network

- Pick Base pre-trained Architecture: Pick a base pre-trained architecture as a starting point for your fine-tuning. Example: bert-base-uncased is one such pre-trained model that can be loaded through Hugging Face Transformers Library
- Extract output from pre-training: How do you want to use the output from pre-training going into *fine-tuning*? a) Extract embedding from the first token, CLS b) Average embeddings of all tokens as a starting point (mean pooling).
- Add fine-tuning layers: Add fine-tuning layers on top of the pre-trained layers. Example, starting with the pooled embeddings, construct one or more dense layers (Feed-Forward NN style) to extract finer representations of the input. Add the output layer and its activation (typically softmax for classification tasks).
- Set training schedule, hyper-parameters, etc: Set up optimizer (e.g. ADAM), hyper-parameters, training schedule, etc for training.

ICE #2

BERT Embeddings and Emotion Detection

Let's say you want to do emotion detection by fine-tuning BERT (Encoding Transformer) on a data set. One of the outputs of the *BERT pre-trained model* for a given input is the *last-hidden-state*. This includes an embedding for every token that was passed into BERT.

Let's say you are going to start with the last hidden layer and use that as input for your *fine-tuned* model. This ICE is about the dimensionality of the inputs and outputs. Let's say you have sentences of the kind: "I am looking forward to today! It's going to be a big day" This sentence conveys excitement. There are 13 words in this input and using *word-piece tokenization*, you arrive at 20 sub-tokens as input into the BERT model. The last hidden layer includes an embedding for every single token. Let's say the embedding dimension for a token is 768.

30 / 46

ICE #2 continued

BERT Embeddings and Emotion Detection

There are 13 words in this input and using *word-piece tokenization*, you arrive at 20 sub-tokens as input into the BERT model. The last hidden layer includes an embedding for every single token. Let's say the embedding dimension for a token is 768. For the purpose of emotion detection - You can either use the *CLS* token (Start token) embedding (also called the pooled embedding) or you can take the average of the embeddings of the tokens in the last hidden layer of BERT. a) What's the dimension of the pooled BERT embedding of this particular input example b) What's the dimension of the total dimension of the last hidden layer?

(Univ. of Washington, Seattle)

Why does pooling of the output need to be done for sequence classification (e.g. emotion detection)?

- Reduces the dimensionality
- Averages context from all the tokens
- Somputational concerns for training the fine-tuned model
- All of the above

Application of SBERT Embeddings to Instacart Recommendations

Instacart Recommendations

Figure 1. Conceptual diagram of a two-tower model

Positive Examples

(Univ. of Washington, Seattle) EEP 596: LLMs: From Transformers to GPT

High-quality Positive Examples

Converted Products for Search Query "Orange"
Navel Oranges
Clementines
Mandarins
Bananas
Strawberries

Negative Examples

Figure 3. (Left) In the vanilla implementation of in-batch negative, all off-diagonal negative samples are given the same weight. (Right) In our implementation with self-adversarial re-weighting, harder examples are given more weight (darker color), making the task more challenging for the model.

Model Training Architecture
