- Auto-complete search results.
- Ohat bots Like ChatGPT/Sparrow/Anthropic, etc

## Email auto-complete

# Image to Text!

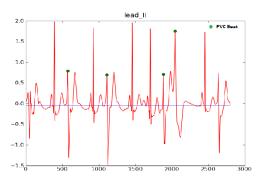

camera, holding, purple

A purple camera with a woman. A woman holding a camera in a crowd.

A woman holding a cat.

#1 A woman holding a camera in a crowd.

# Arrhythmia Detection

# Brief History of Deep Learning

- 1965: First deep-learning model came out in 1965 by Ivakhenko et al. Didn't use back-propagation for training but sequential least squares fit.
- 1979: Earliest Convolutional Neural Network (CNN) by Fukushima et al.
- 1985: Earliest back-propagation in 1985 by Hinton et al
- 1989: Application of back-prop for recognizing MNIST hand-written digits at Bell labs by Yann LeCun
- 1993: LeNet by Yann LeCun. The beginning of the X-Nets where X could be Alex, Inception, etc
- 1997: Discovery of recurrent Neural Nets RNN and LSTMs in 1997 by Horchreiter and Schmidhuber.

# Brief History of Deep Learning

- **1997 2006**: GPUs got faster 1000x computational speed improvement
- 2011: Ciresan et al showed that you can train a CNN without pre-trained weights just with good computational power.
- **2012:** Beginning of ILSVRC competition for improving image-net data set performance.
- 2017: Transformers arrive on the scene with Vaswani et al and begin the Language Model revolution.
- 2020: Transformer gets applied to Vision as well and matches CNN in performance through the Vi-Transformer.
- 2022: ChatGPT (based on transformers) arrives on the scene and puts AI on the world map!

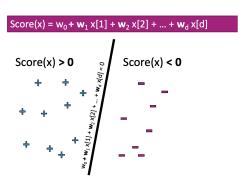

# Perceptron to Deep Neural Networks/Deep Learning

# Logistic Regression to Deep Learning

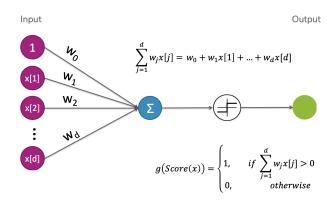

#### Linear to Non-linear Models

Let's work through the nitty-gritties of the logistic regression model and neural network model!

## Perceptron

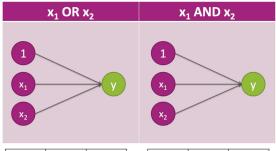

## Perceptron

## **OR and AND Functions**

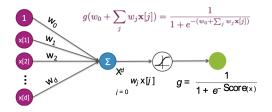

What can a perceptrons represent?

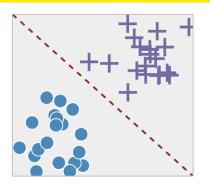

<i>x</i> <sub>1</sub>	$x_2$	у
0	0	0
0	1	1
1	0	1
1	1	1

<i>x</i> <sub>1</sub>	<i>x</i> <sub>2</sub>	у
0	0	0
0	1	0
1	0	0
1	1	1

## Perceptron to Logistic Regression

# Logistic Regression

#### LR fundamentals

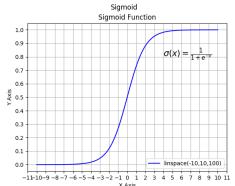

- Linear Model
- Want score  $w^T x^i > 0$  for  $y_i = +1$  and  $w^T x_i < 0$  for  $y_i = -1$ !
- If linearly separable data, above is feasible. Else, minimize error in separability!!

# Logistic Regression

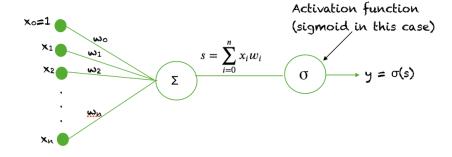

#### Probability for a class

In LR, the score,  $w^Tx$  is converted to a probability through the sigmoid function. So we can talk about  $P(\hat{y}^i = +1)$  or  $P(\hat{y}^i = -1)$ 

### Sigmoid Function

#### LR represented Graphically

#### Logistic Regression

#### LR Prediction

$$\hat{y}_i = \frac{1}{1 + e^{-\hat{w}^T x^i}}$$

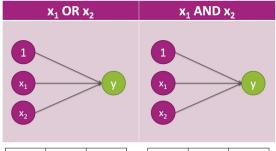

#### LR Loss

Assume that  $y_i = 0$  or  $y_i = 1$  (i.e. the negative class has a label 0). Then the binary cross-entropy loss applies to LR:

$$\min_{w} y_i \log(\hat{y}_i) + (1 - y_i) \log(1 - \hat{y}_i)$$

#### **OR and AND Functions**

What can a perceptrons represent?

<i>x</i> <sub>1</sub>	$x_2$	у
0	0	0
0	1	1
1	0	1
1	1	1

$x_1$	<i>x</i> <sub>2</sub>	у
0	0	0
0	1	0
1	0	0
1	1	1

# Learning XOR

#### XOR through Multi-layer perceptron

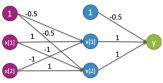

This is a 2-layer neural network

$$y = x[1] XOR x[2] = (x[1] AND ! x[2]) OR (! x[1] AND x[2])$$

$$v[1] = (x[1] AND ! x[2])$$
  
=  $g(-0.5 + x[1] - x[2])$ 

$$v[2] = (!x[1] AND x[2])$$
  
=  $g(-0.5 - x[1] + x[2])$ 

$$y = v[1] OR v[2]$$
  
=  $g(-0.5 + v[1] + v[2])$ 

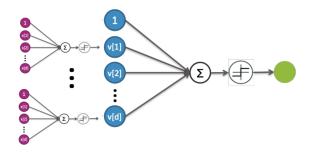

#### ICE #1

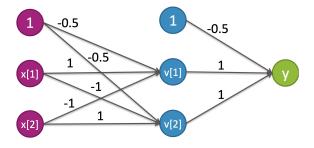

#### Which methods can learn the XOR function?

- Logistics Regression
- Naive Bayes Classifier
- Oecision Trees
- Support Vector Machines

#### Multi-Layer Perceptron (MLP)

### Multi-Layer Perceptron (MLP)

#### 2 Layer Neural Network

Two layer neural network (alt. one hidden-layer neural network)

Single

$$out(x) = g\left(w_0 + \sum_j w_j x[j]\right)$$

1-hidden laver

$$out(x) = g\left(w_0 + \sum_k w_k g\left(w_0^{(k)} + \sum_j w_j^{(k)} x[j]\right)\right)$$

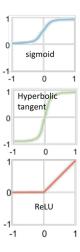

### Deep Learning: Activations, FFN and more

#### Choices for Non-Linear Activation Function

- Sigmoid
- -Historically popular, but (mostly) fallen out of favor
- Neuron's activation saturates

(weights get very large -> gradients get small)

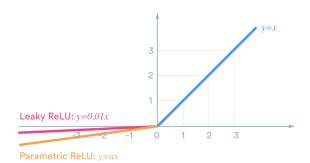

- •Not zero-centered -> other issues in the gradient steps -When put on the output layer, called "softmax" because
- interpreted as class probability (soft assignment)
- •Hyperbolic tangent  $g(x) = \tanh(x)$
- -Saturates like sigmoid unit, but zero-centered
- •Rectified linear unit (ReLU)  $g(x) = x^+ = max(0,x)$
- -Most popular choice these days
- -Fragile during training and neurons can "die off"... be careful about learning rates
- -"Noisy" or "leaky" variants
- •Softplus g(x) = log(1 + exp(x))
- -Smooth approximation to rectifier activation

#### ICE #2

#### Compute the number of parameters in DNN model

Consider a DNN model with 3 hidden layers where each hidden layer has 1000 neurons. Let the input layer be raw pixels from a 100x100 image and the output layer has 10 dimensions, let's say for a 10 class image classification example. How many total parameters exist in the DNN model?

- 10 million parameters
- 2 11 million parameters
- 12 million parameters
- 4 13 million parameters

### Training a DNN

#### SGD with mini-batch

SGD mini-batch is the staple diet. However there are some **learning rate schedulers** that are known to work better for DNNs - Such as Adagrad and more recently, ADAM. ADAM adapts the learning rate to each individual parameter instead of having a global learning rate.

#### Training a DNN

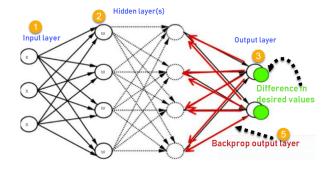

#### SGD with mini-batch

SGD mini-batch is the staple diet. However there are some **learning rate schedulers** that are known to work better for DNNs - Such as Adagrad and more recently, ADAM. ADAM adapts the learning rate to each individual parameter instead of having a global learning rate.

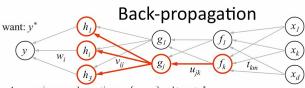

How do we compute gradient in a DNN?

Back-propagation!

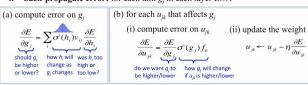

### Forward Propagation vs Back-propagation

#### **Back Propagation explained**

- 1. receive new observation  $\mathbf{x} = [x_1 ... x_d]$  and target  $y^*$
- 2. **feed forward:** for each unit  $g_j$  in each layer 1...L compute  $g_j$  based on units  $f_k$  from previous layer:  $g_j = \sigma \left( u_{j0} + \sum_i u_{jk} f_k \right)$
- 3. get prediction y and error  $(y-y^*)$
- back-propagate error: for each unit g<sub>i</sub> in each layer L...1

Copyright © 2014 Victor Lavrenko

### **Back Propagation Summary**

#### Back Prop

Back prop is one of the fundamental backbones of the training modules behind deep learning and beyond (including for example ChatGPT). What exactly is back prop? It is just a way to unravel gradient computation in the neural network. Back prop is how we would **compute the gradient** in a neural network.

### **Back Propagation Summary**

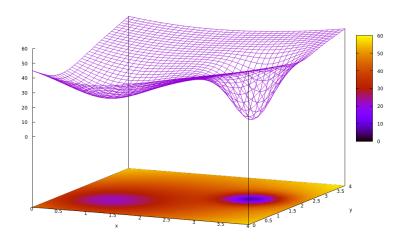

#### Back Prop

Back prop is one of the fundamental backbones of the training modules behind deep learning and beyond (including for example ChatGPT). What exactly is back prop? It is just a way to unravel gradient computation in the neural network. Back prop is how we would **compute the gradient** in a neural network.

#### Back Prop as information flow

It can also be thought of as flow information from the error in the output (the loss function) down to the weights. Update the weights so we don't make **this error** next time around. Back prop is a way to do **gradient descent in neural networks!** 

#### Good vs Bad Local minima

ICE #3: Which of the following is not a hyper-parameter in deep learning?

- Learning rate
- Number of Hidden Layers
- Number of neurons per hidden layer
- All of the above

#### Hyper-parameters

- Learning rate
- Number of Hidden Layers
- Number of neurons per hidden layer

#### Hyper-parameters

- Learning rate
- Number of Hidden Layers
- Number of neurons per hidden layer
- Type of non-linear activation function used

#### Hyper-parameters

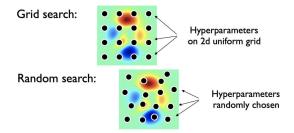

- Learning rate
- Number of Hidden Layers
- Number of neurons per hidden layer
- Type of non-linear activation function used
- Anything else?

### Hyper-parameter tuning methods

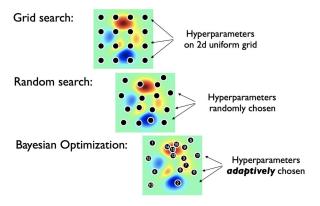

### Hyper-parameter tuning methods

### Hyper-parameter tuning methods

#### How to handle over-fitting in DNNs

A DNN model with 100 million parameters and only 100k data points or even a million data points will overfit unless we take care of over-fitting.

- A DNN model with 100 million parameters and only 100k data points or even a million data points will overfit unless we take care of over-fitting.
- **2** Weight regularization can help  $\ell_1,\ell_2$

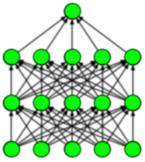

- A DNN model with 100 million parameters and only 100k data points or even a million data points will overfit unless we take care of over-fitting.
- ② Weight regularization can help  $\ell_1,\ell_2$
- More common over-fitting strategy for DL?

- A DNN model with 100 million parameters and only 100k data points or even a million data points will overfit unless we take care of over-fitting.
- ② Weight regularization can help  $\ell_1,\ell_2$
- More common over-fitting strategy for DL?
- Oropouts!

- ② Weight regularization can help  $\ell_1,\ell_2$
- More common over-fitting strategy for DL?
- Oropouts!
- Early stopping is also a great strategy! Stop training the DL model when the validation error starts increasing. How's this different from regular validation we were doing earlier??

#### Neural Networks Zoo

### **Auto Encoders**

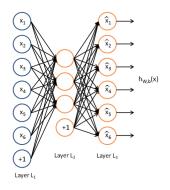

### ICE #4

#### PCA vs Auto Encoder

Which of the following statements are true ?

- Both PCA and Auto Encoders serve the purpose of dimensionality reduction
- They are both linear models but one uses a neural nets architecture and the other is based on projections
- PCA is robust to outliers while Auto Encoders are not
- Auto Encoders are as better than Glove Embeddings to find low-dim embeddings for words

### PCA vs Auto-Encoders

### AutoEncoders and Dimensionality Reduction

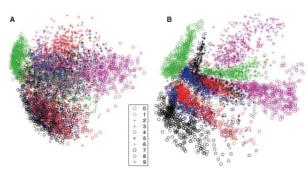

Visualization Performance

Auto Encoder Reference Paper

# AutoEncoders and Dimensionality Reduction

#### Reading Reference for AE Dimensionality Reduction

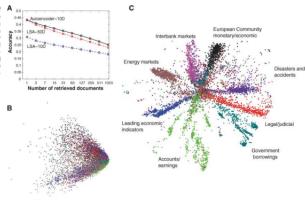

Fig. 3. (A) The twodimensional codes for 500 digits of each class produced by taking the first two principal components of all 60,000 training images. (B) The two-dimensional codes found by a 784-1000-500-250-2 autoencoder. For an alternative visualization, see (B).

# AutoEncoders and Dimensionality Reduction

#### Reading Reference for AE Dimensionality Reduction

Fig. 4. (A) The fraction of retrieved documents in the same class as the query when a query document from the test set is used to retrieve other test set documents, averaged over all 402,207 possible queries. (B) The codes produced by two-dimensional LSA. (C) The codes produced by a 2000-500-250-125-2 autoencoder.

 Auto-Encoders are a method for dimensionality reduction and can do better than PCA for visualization

- Auto-Encoders are a method for dimensionality reduction and can do better than PCA for visualization
- Use Neural Networks architecture and hence can encode non-linearity in the embeddings

- Auto-Encoders are a method for dimensionality reduction and can do better than PCA for visualization
- Use Neural Networks architecture and hence can encode non-linearity in the embeddings
- Anything else?

- Auto-Encoders are a method for dimensionality reduction and can do better than PCA for visualization
- Use Neural Networks architecture and hence can encode non-linearity in the embeddings
- Anything else?
- Auto Encoders can learn convolutional layers instead of dense layers -Better for images! More flexibility!!

# Coloring Images

#### **Details**

Just like an Auto Encoder

#### **Details**

- Just like an Auto Encoder
- Difference: Noise is injected in the inputs on purpose but output is a clean data point.

#### **Details**

- Just like an Auto Encoder
- Difference: Noise is injected in the inputs on purpose but output is a clean data point.
- This forces the Auto Encoder to "de-noise" data, esp. useful for images!

#### **Details**

- Just like an Auto Encoder
- Difference: Noise is injected in the inputs on purpose but output is a clean data point.
- This forces the Auto Encoder to "de-noise" data, esp. useful for images!
- Esp. useful for a category of objects or images (e.g. digit recognition or face recognition, etc)

### ICE #5

#### Unsupervised Learning

Which of these is NOT an example of unsupervised learning?

- Perceptron
- 2 Auto Encoder
- Oe-noising Auto Encoder
- K-means++
- None of the above
- All of the above

#### **Breakouts Time 1**

#### 5 mins

Discuss in your groups what are some real-world applications of any or many of the Auto Encoder Architectures we discussed so far you can think of in your area of work or in a standard context e.g. images.

### Example

I love this car! Positive Sentiment

### Example

I love this car! Positive Sentiment

#### Example

I am not sure I love this car! Negative Sentiment

#### Example

I love this car! Positive Sentiment

#### Example

I am not sure I love this car! Negative Sentiment

#### Example

I don't think its a bad car at all!  $\rightarrow$  Positive Sentiment

#### Example

I love this car! Positive Sentiment

#### Example

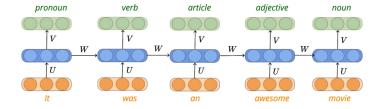

I am not sure I love this car! Negative Sentiment

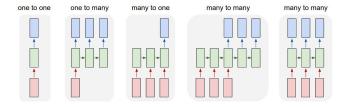

#### Example

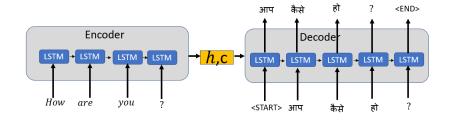

I don't think its a bad car at all!  $\rightarrow$  Positive Sentiment

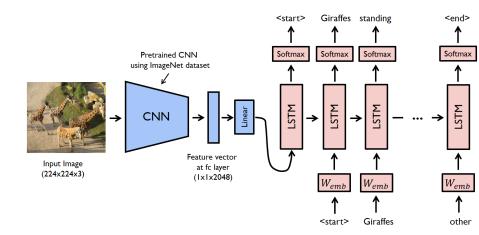

#### Example

Have to carry the **context(state)** from some-time back to fully understand what's happening!

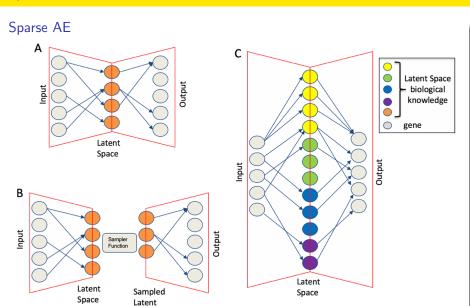

### Breakouts Time #2

#### Auto-complete — 5 mins

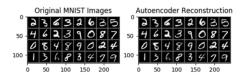

Let's say you are tasked with building an in-email auto-completion application, which can help complete partial sentences into full sentences through suggestions (auto-complete). How would you use what we have learned so far to model this? What architecture would you use? What would be your data? And what are some pitfalls or painpoints your model should address?

### Extra Slides

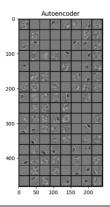

### Sparse AE Reference

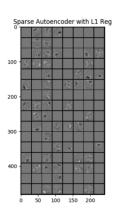

Methods	Best MSE Loss (MNIST or CIFAR-10)
Simple Autoencoder	0.0318 (MNIST)
Sparse Autoencoder (L1 reg)	0.0301 (MNIST)

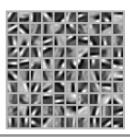

Experiment Results

### Sparse AE Reference

Input Image that maximizes activations for each neuron in hidden layer!
