A methodology for fine-tuning transformers for classification tasks

Pick Base pre-trained Architecture: Pick a base pre-trained architecture as a starting point for your fine-tuning. Example: bert-base-uncased is one such pre-trained model that can be loaded through Hugging Face Transformers Library

A methodology for fine-tuning transformers for classification tasks

- Pick Base pre-trained Architecture: Pick a base pre-trained architecture as a starting point for your fine-tuning. Example: bert-base-uncased is one such pre-trained model that can be loaded through Hugging Face Transformers Library
- Extract output from pre-training: How do you want to use the output from pre-training going into *fine-tuning*? a) Extract embedding from the first token, CLS b) Average embeddings of all tokens as a starting point (mean pooling).

A methodology for fine-tuning transformers for classification tasks

- Pick Base pre-trained Architecture: Pick a base pre-trained architecture as a starting point for your fine-tuning. Example: bert-base-uncased is one such pre-trained model that can be loaded through Hugging Face Transformers Library
- Extract output from pre-training: How do you want to use the output from pre-training going into *fine-tuning*? a) Extract embedding from the first token, CLS b) Average embeddings of all tokens as a starting point (mean pooling).
- Add fine-tuning layers: Add fine-tuning layers on top of the pre-trained layers. Example, starting with the pooled embeddings, construct one or more dense layers (Feed-Forward NN style) to extract finer representations of the input. Add the output layer and its activation (typically softmax for classification tasks).

A methodology for fine-tuning transformers for classification tasks

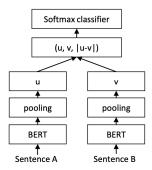

- Pick Base pre-trained Architecture: Pick a base pre-trained architecture as a starting point for your fine-tuning. Example: bert-base-uncased is one such pre-trained model that can be loaded through Hugging Face Transformers Library
- Extract output from pre-training: How do you want to use the output from pre-training going into *fine-tuning*? a) Extract embedding from the first token, CLS b) Average embeddings of all tokens as a starting point (mean pooling).
- Add fine-tuning layers: Add fine-tuning layers on top of the pre-trained layers. Example, starting with the pooled embeddings, construct one or more dense layers (Feed-Forward NN style) to extract finer representations of the input. Add the output layer and its activation (typically softmax for classification tasks).
- Set training schedule, hyper-parameters, etc: Set up optimizer (e.g. ADAM), hyper-parameters, training schedule, etc for training.

Transformers Use-Cases Over-view

Use-Cases for Two Tower Architecture

Two-Tower Architecture

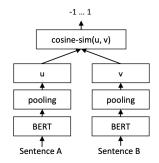

Figure 1: SBERT architecture with classification objective function, e.g., for fine-tuning on SNLI dataset. The two BERT networks have tied weights (siamese network structure).

Figure 2: SBERT architecture at inference, for example, to compute similarity scores. This architecture is also used with the regression objective function.

Pooling Strategy for SBERT

	NLI	STSb				
Pooling Strategy						
MEAN	80.78	87.44				
MAX	79.07	69.92				
CLS	79.80	86.62				
Concatenation						
(u,v)	66.04	-				
(u-v)	69.78	-				
(u * v)	70.54	-				
(u-v , u * v)	78.37	-				
(u, v, u * v)	77.44	-				
(u,v, u-v)	80.78	-				
(u,v, u-v ,ust v)	80.44	-				

Table 6: SBERT trained on NLI data with the classification objective function, on the STS benchmark (STSb) with the regression objective function. Configurations are evaluated on the development set of the STSb using cosine-similarity and Spearman's rank correlation. For the concatenation methods, we only report scores with MEAN pooling strategy.

Sentence BERT Cosine Similarity Results

Model	STS12	STS13	STS14	STS15	STS16	STSb	SICK-R	Avg.
Avg. GloVe embeddings	55.14	70.66	59.73	68.25	63.66	58.02	53.76	61.32
Avg. BERT embeddings	38.78	57.98	57.98	63.15	61.06	46.35	58.40	54.81
BERT CLS-vector	20.16	30.01	20.09	36.88	38.08	16.50	42.63	29.19
InferSent - Glove	52.86	66.75	62.15	72.77	66.87	68.03	65.65	65.01
Universal Sentence Encoder	64.49	67.80	64.61	76.83	73.18	74.92	76.69	71.22
SBERT-NLI-base	70.97	76.53	73.19	79.09	74.30	77.03	72.91	74.89
SBERT-NLI-large	72.27	78.46	74.90	80.99	76.25	79.23	73.75	76.55
SRoBERTa-NLI-base	71.54	72.49	70.80	78.74	73.69	77.77	74.46	74.21
SRoBERTa-NLI-large	74.53	77.00	73.18	81.85	76.82	79.10	74.29	76.68

Table 1: Spearman rank correlation ρ between the cosine similarity of sentence representations and the gold labels for various Textual Similarity (STS) tasks. Performance is reported by convention as $\rho \times 100$. STS12-STS16: SemEval 2012-2016, STSb: STSbenchmark, SICK-R: SICK relatedness dataset.

SentEval DataSets

- MR: Sentiment prediction for movie reviews snippets on a five start scale (Pang and Lee, 2005).
- **CR**: Sentiment prediction of customer product reviews (Hu and Liu, 2004).
- **SUBJ**: Subjectivity prediction of sentences from movie reviews and plot summaries (Pang and Lee, 2004).
- MPQA: Phrase level opinion polarity classification from newswire (Wiebe et al., 2005).
- SST: Stanford Sentiment Treebank with binary labels (Socher et al., 2013).
- **TREC**: Fine grained question-type classification from TREC (Li and Roth, 2002).
- MRPC: Microsoft Research Paraphrase Corpus from parallel news sources (Dolan et al., 2004).

Sentence BERT on SentEval Results

Model	MR	CR	SUBJ	MPQA	SST	TREC	MRPC	Avg.
Avg. GloVe embeddings	77.25	78.30	91.17	87.85	80.18	83.0	72.87	81.52
Avg. fast-text embeddings	77.96	79.23	91.68	87.81	82.15	83.6	74.49	82.42
Avg. BERT embeddings	78.66	86.25	94.37	88.66	84.40	92.8	69.45	84.94
BERT CLS-vector	78.68	84.85	94.21	88.23	84.13	91.4	71.13	84.66
InferSent - GloVe	81.57	86.54	92.50	90.38	84.18	88.2	75.77	85.59
Universal Sentence Encoder	80.09	85.19	93.98	86.70	86.38	93.2	70.14	85.10
SBERT-NLI-base	83.64	89.43	94.39	89.86	88.96	89.6	76.00	87.41
SBERT-NLI-large	84.88	90.07	94.52	90.33	90.66	87.4	75.94	87.69

Table 5: Evaluation of SBERT sentence embeddings using the SentEval toolkit. SentEval evaluates sentence embeddings on different sentence classification tasks by training a logistic regression classifier using the sentence embeddings as features. Scores are based on a 10-fold cross-validation.

Given all the architecutures and knowledge of embeddings that we have discussed so far in class - Discuss your approaches for Kaggle 1 and Kaggle 2 tasks. Let's say you have an approach for Kaggle 1 contest. You have put in your submission for the leaderboard. Can you leverage your model for Kaggle 1 with add ons/creativity to do zero-shot learning in Kaggle 2? Remember, in Kaggle 2 - The input includes labels the model hasn't seen yet in training!
